Azure Essentials

Thien Nguyen

Azure subscription model

Azure Resource Manager

- Portal
- Azure PowerShell
- Azure CLI
- Templates

Azure management levels and hierarchy

- **Management groups** help you manage access, policy, and compliance for multiple subscriptions. All subscriptions in a management group automatically inherit the conditions that are applied to the management group.
- **Subscriptions** Organizations can use subscriptions to manage costs and the resources that are created by users, teams, and projects. Each subscription has limits or quotas on the amount of resources that it can create and use
- **Resource groups** are logical containers where you can deploy and manage Azure resources like web apps, databases, and storage accounts.
- **Resources** are instances of services that you can create, such as virtual machines, storage, and SQL databases

Azure RBAC

1 Security principal

A *security principal* is an object that represents a user, group, service principal, or managed identity that is requesting access to Azure resources. You can assign a role to any of these security principals

2 Role definition

3 Scope

Lower levels inherit role permissions from higher levels

Managed Identity

Azure Managed Identities eliminate the headache of managing secrets. This allows services to authenticate securely to resources supporting Entra authentication.

	System-assigned managed identity	User-assigned managed identity
Creation	Created as part of an Azure resource (for example, Azure Virtual Machines or Azure App Service).	Created as a stand-alone Azure resource
Life cycle	Shared life cycle with the Azure resource that the managed identity is created with. When the parent resource is deleted, the managed identity is deleted as well.	Independent life cycle. Must be explicitly deleted.
Sharing across Azure resources	Can't be shared. It can only be associated with a single Azure resource.	Can be shared. The same user-assigned managed identity can be associated with more than one Azure resource.

Service Endpoint vs Private Endpoint

Public Endpoint

Firewall setting:

- Public IP addresses/ranges

Service Endpoint

With service endpoints, service traffic switches to use virtual network private addresses as the source IP addresses when accessing the Azure service from a virtual network

Private Endpoint

Private Endpoint

Azure Private Link enables you to access Azure PaaS Services (for example, Azure Storage and SQL Database) over a private endpoint in your virtual network.
